

Cyan Erick Pascual

Senior Full-Stack Web3 Engineer

cbpas3@gmail.com | cyan.codes | github.com/cbpas3 | Taguig City, PH

SUMMARY

Senior full-stack web3 engineer with 5+ years of software experience and 2 years specializing in production EVM and Solana infrastructure. Authored Decurity-audited contracts securing 15,000+ physically backed tokens through a \$6.1M seed round (Arx/ERS); implemented a Sherlock-audited keeper system managing ~\$259K TVL (Aerostrategy); shipped an end-to-end launchpad processing \$28.5K+ USDC volume (Onyx). Deep Solidity/Yul and Scrypto experience across the full stack, from assembly-level gas optimization to React/Viem dApps. AI-augmented workflow (Claude Code, Gemini, Antigravity) for rapid, secure delivery.

TECHNICAL SKILLS

Smart Contracts: Solidity, Yul (assembly), Scrypto (Rust, Radix), Foundry, Hardhat, ERC-721/1155/3668, Diamond proxy (EIP-2535), UUPS/Transparent proxies, clone factories, metamorphic contracts, TWAP oracles, bonding curves, vesting & graduation logic

Chains & Ecosystems: Base, Ethereum, Solana, SKALE, Radix; cross-chain migration (EVM → Solana); keeper / autonomous execution systems

Web3 Frontend: Viem, Wagmi, Ethers.js (v5 & v6 migration experience), Solana Web3.js, Thirdweb auth, wallet adapters, batched multicalls, optimistic mutations

Backend & Indexing: Node.js, Next.js 14 (Server Actions), PostgreSQL, Redis, AWS S3, Arweave, Firebase; Envio HyperIndex with dynamic factory listeners; real-time OHLCV pipelines

Security: Sherlock-audited and Decurity-audited codebases shipped; TWAP / MEV mitigations; non-custodial execution logic; vulnerability assessment (RareSkills, Ethernaut, Damn Vulnerable DeFi)

Frontend: React, Next.js, React Native, Vite, TailwindCSS, React Query

AI-Augmented Workflow: Claude Code, Gemini, Antigravity, local LLMs (Ollama), multi-agent orchestration, prompt engineering

EXPERIENCE

Bytecode Collective — Senior Full-Stack Web3 Engineer *Jan 2025 – Present*

Aerostrategy — yield aggregator on Base — aerostrategy.finance

- Implemented the Sherlock-audited 'Buyback & Burn' engine for a Base yield aggregator, securing ~\$259K TVL in veAERO voting locks and replacing manual treasury operations with a trustless keeper system.
- Integrated Aerodrome's PermanentLocksPoolV1 (Autopilot) to programmatically claim accrued USDC rewards, orchestrating permissionless ~\$270 daily buyback cycles that maintain the AEROSTRAT token peg.
- Built the DeFi dashboard in React/Viem with batched multicalls to aggregate on-chain governance data and DexScreener APIs, surfacing real-time APR tracking.
- Implemented non-custodial execution logic and TWAP protection to secure protocol revenue against slippage and MEV attacks.

Onyx — decentralized token launchpad — onyx.bond

- Shipped end-to-end infrastructure (React/Vite frontend, Node.js/Postgres backend, custom Envio indexer) for a decentralized launchpad that processed \$28,500+ in USDC volume across 50+ on-chain transactions and successfully executed graduation and liquidity backing for a project hitting its \$25K funding cap.
- Built a custom Envio HyperIndex with dynamic factory listeners to overcome RPC rate limits, auto-indexing new token launches across 12 bonding curves and generating real-time OHLCV charts.

- Designed a hybrid storage system using Arweave for immutable token metadata and AWS S3 for media, balancing decentralization with UX.
- Built the investor dashboard visualizing complex vesting schedules and refund logic with batched RPC calls (Viem) to reduce network load.
- Led the protocol's cross-chain migration from Base (EVM) to Solana, reimplementing core vesting logic and integrating Solana wallet adapters.

Odds & Ends — Senior Full-Stack / Smart Contract Developer (contract) *Feb 2024 – Jun 2025*

Clementine's Nightmare — NFT marketplace on Base — clementinesnightmare.io

- Built the marketplace frontend handling trade volume for 15,000+ in-game NFTs in an ecosystem with ~1,250 ETH in prior primary sales.
- Interfaced with a Diamond proxy (EIP-2535) smart contract system spanning Marketplace, ERC-721/1155, Rewards, and CardPack facets via Ethers.js.
- Engineered a full gamification layer — daily login streaks, task-based reward points, referral tracking, and a card-pack purchase flow with multi-payment support (USDC/ETH/Rewards) — driving retention and on-chain interaction.
- Built a server-driven data layer using Next.js 14 Server Actions for secure fetching and React Query for client state, with cookie-based JWT auth via Thirdweb and middleware-level NFT view tracking for analytics.
- Developed listing, offer, and trade interfaces with optimistic mutations and collection-level analytics (floor price / volume with 1H–1M time-series diffs).

Additional: Dan XRD (Radix/Scripto staking dApp for a native fungible token), The NFT Arcade (cross-chain NFT marketplace on SKALE with secure token bridging), Mintpass (React Native app with Facebook/Google/Apple social login and a scoring system), Fantasy Friends (automated token airdrop pipelines and proxy-based contract upgradeability).

Arx Research Inc. — Smart Contract Developer *Jan 2023 – Jan 2024*

Ethereum Reality Service (ERS) — physically backed tokens — ers.to

- Authored the Decurity-audited Project Registrar (now BaseProjectRegistrar) and Enrollment Manager smart contracts, establishing foundational non-custodial infrastructure that currently secures 15,000+ Physically Backed Tokens (PBTs); work supported protocol scale through a \$6.1M seed round.
- Contributed to lib-ers, the official frontend library for decentralized chip resolution, owning core ERC-3668 (CCIP Read) interactions and leading the web3 stack migration from Ethers v5 to Viem.
- Built full-stack Next.js/Redis applications bridging NFC hardware wallets (HaLo chips) with EVM environments, translating cryptographic proofs into frictionless mobile scanner flows for on-chain proof of custody.

Vyersoft — Software Developer *Nov 2021 – Oct 2022*

- Engineered the end-to-end minting dApp for the Spike NFT project, integrating a React.js frontend with Node.js + Firebase to securely manage token metadata and real-time state synchronization.
- Developed the web interface and backend state-tracking logic for the project's NFT staking mechanism, allowing users to lock assets and monitor yield in real time.

EDUCATION & TRAINING

B.S. Geodetic Engineering — prior 2 years of Computer Science coursework; geospatial data science focus.

RareSkills Blockchain Engineering Fellowship *Jul 2022 – Dec 2022*

Selective fellowship on EVM mechanics, gas optimization, and smart contract security. Re-implemented ERC-1155 purely in Yul assembly; built proxy patterns, clone factories, and metamorphic contracts; audited Ethernaut and Damn Vulnerable DeFi.
